                                               on a saccharide having at least three sugar units, which are pref.

glucose units at the reducing end (the linkage between the first and
second glucose units is alpha-1, while the linkage between the
second and third glucose units is alpha-1,4), to hydrolyse alpha-1,4
linkages within the sugar chain, yielding alpha, alpha-trehalose and also
mono- and disaccharide hydrolysis products. The amplase has a mal. wt. of
61 to 64 kba. It is characterised by working at pH 4.5-5.5 and at 60-85
deg.C. It has an isoelectric point of 4.3-5.4 and retains at least
100 percent activity after 6 hrs at 80 deg.C. It is completely inhibited
by 5 mm copper sulphate. Use of a transferase and the amylase in
succession on suitable substrates such a malto-oligosaccharides, is
                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A thermostable enzyme (AAR92755) of Sulfolobus acidocaldarius AFCC 33909 releases trehalose from non-reducing saccharides having a trehalose structure as an end unit and a degree of polymerisation of at least 3. It has a mol.wt. of 54.64 kDa (SDS-PAGE), a pl of 5.6-6.6 and is substantially not inactivated when incubated in aq. solution (PH 7.0) at 85 deg for 60 min. Recombinant enzyme is obtd. by expression of an isolated DNA fragment (AAT16899) in host cells, pref. Escherichia coli, using e.g. vector pBluescript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sulfolobus acidocaldarius, -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The amylase is derived from Sulfolobus acidocaldarius. The amylase acts on a saccharide having at least three sugar units, which are pref. glucose units at the reducing end (the linkage between the first and second glucose units is alpha-1, alpha-1, while the linkage between the second and third glucose units is alpha-1, while the linkage between the second and third glucose units is alpha-1, while the linkage alpha-1, linkages within the sugar chain, yielding alpha, alpha-trehalose and also mono- and disaccharide hydrolysis products. The amylase has a mol. wt. of 61 to 64 kDa. It is characterised by working at pH 4.5-5.5 and at 60-85 deg.C. It has an isoelectric point of 4.3-5.4 and retains at least 100 percent activity after 6 hrs. at 80 deg.C. It is completely inhibited by 5 mw copper sulphate. Use of a transferase and the amylase in succession on sultable substrates such a malto-oligosaccharides, is useful for the production of alpha, alpha-trehalose.

                                                                                                                                                                                                                                                                  The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                        Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         36.6%; Score 1089.5; DB 22; Length 595;

                                                                                                                                                                                                                                                                                                             AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes.
                                                                                                                                                                                                                                               acids,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This enzyme can be used for the preparation of trehalose with high yields and efficiency from non-reducing saccharides such as alpha-glucosyltrehalose, alpha-maltotsyltrehalose and alpha-maltottriosyltrehalose. The trehalose can be used as a sweetener, taste-improving agent, quality-improving agent, stabiliser, filler, excipient or adjuvant in food products cosmetics and pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       --TLNNVKVRDRYKYVLD-DASEIPDPASRYQPEGVHGPSQIIQESK-EFNNETFLKKE- 101

The trehalose can be used as a sweetener, taste-improving agent, quality-improving agent, stabiliser, filler, excipient or adjuvant in food products cosmetics and pharmaceuticals.
                                                                                                                                                                                                   Enzyme; trehalose; alpha-glucosyltrehalose; alpha-maltosyltrehalose; alpha-maltotertrasyltrehalose; amaltotertrasyltrehalose; sweetener; taste-improving agent; stabiliser; filler; exciplent; adjuvant; foodstuffs; cosmetics;

This sequence represents a trehalose-releasing enzyme amino acid sequence from Arthrobacter sp. S34. This enzyme specifically hydrolyses a non-reducing saccharide having a trehalose structure as an end unit. The invention relates to this enzyme and also to a non-reducing saccharide forming enzyme that forms a non-reducing saccharide having a trehalose structure as an end unit by reducing partial starch hydrolysates. The two enzymes can be used to produce trehalose, a disaccharide consisting of two moles of glucose bound at their reducing residues. The disaccharide is substantially free of reducibility and has moisture retaining abilities. The enzymes are used to produce non-reducing sugars, they are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New mesophilic enzyme from Arthrobacter, used to convert starch hydrolysate into non-reducing sugars, particularly trehalose, useful as a sweetener in foods, pharmaceuticals and cosmetics -

13;
particularly used for further enzymatic conversion of starch hydrolysate to trehalose. The non-reducing sugars produced by the enzymes are useful in foods, pharmaceuticals and cosmetics. Non-reducing sugars are compatible with amino acids and proteins, they do not cause browning, and have good moisture-retaining properties. The enzymes produce the non-reducing sugars in high yield and function at a medium temperature range i.e. between 40 degrees celsius and 60 degrees celsius, and in an acidic pH range, i.e. a pH of less than 7 Production of non-reducing sugars using the enzymes eliminates the need to convert a starch by decological acidic for sugar alcohols (non-reducing) by catalytic

S34. This enzyme specifically hydrolyses a non-reducing saccharide having a trehalose structure as an end unit. The invention relates to this enzyme and also to a non-reducing saccharide forming enzyme that forms a non-reducing saccharide having a trehalose structure as an end unit by reducing partial starch hydrolysates. The two enzymes can be used to produce trehalose, a disaccharide consisting of two moles of glucose bound at their reducing residues. The disaccharide is substantially free of reducibility and has moisture retaining abilities. The enzymes are used to produce non-reducing sugars, they are particularly used for further enzymatic conversion of starch hydrolysate to trehalose. The non-reducing sugars are used to produce by the enzymes are useful in foods, pharmaceuticals and cosmetics. Non-reducing sugars are compatible with amno acids and proteins, they do not cause browning, and have good moisture-retaining properties. The enzymes produce the con-reducing sugars in high yield and function at a medium temperature acidic pH range, i.e. a pH of less than 7. Production of non-reducing sugars using the enzymes claiminates the need to convert a starch budge hydrolysate into sugar alcohols (non-reducing) by catalytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a thermostable starch- branching-enzyme (C-enzyme, EC-2.4.1.18) from Bacillus stearothermophilus TRBE14 (C-enzyme, EC-2.4.1.18) from Bacillus stearothermophilus TRBE14 (C-enzyme, EC-2.4.1.18) from Bacillus stearothermophilus TRBE14 (C-enzyme, EC-2.4.1.18) from Bacillus are used to construct primers AAT27126-7, which are used in PCR to amplify a fragment of the gene, which is then used as a probe to isolate a construct primers AAT27126-7, which are used in PCR to amplify a construct primer enzyme may be reacted with starch or amylopectin to produce a glucan with a degree of polymerisation of at least 50, with an inner branched cyclic region and an outer branched region. The product is freely soluble in water, forming a low-viscosity solution, is more resistance to degradation than native starch, does not react with proteins and amino acids, and is degraded to glucose in vivo, so is easily digestible. The glucan may be used in foods, beverages, food-additives, adhesives, in cyclodextrin production and as a constant of the constant 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  50 NVKVRDRYKY--VLDDASEI--PDPASRYQPEGVHGPSQIIQESK--EFNNETFLKK--- 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       enleghlykyeivtpdggvlfkadpyafyselrphtas-iaydlkgygwndgswkrkkrr 140

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acid bacteria, esp. Lactobacillus plantarum and B. facealis, transformed with an exogenous DNA encoding an enzyme which breaks down an oligosaccharide and/or a polysaccharide into a fermentable carbohydrate. The exogenous enzyme is especially an alpha-amylase (AAP94635) encoded by the DNA sequence in AAN91246 (claims 2, 6 and 10). The transformed lactic acid bacteria can break down polysaccharides and oligosaccharides in a silage crop to provide a complete source of the fermentable carbohydrates that the lactic acid bacteria need for producing lactic acid. Also claimed is a probictic characterised by the transformed lactic acid bacteria which can be used for establishing and maintaining optimal intestinal flora in animals, including humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              29;

encoded by the glgB gene. It is stable at high temps. and can be produced in large amts. using recombinant techniques. It is a transferase allowing formation of alpha(1-6) branches in starch-like substances. It is useful for extending the shelf life of such materials and can be used in the prepn. of human and animal foods.
                                                                                                                                                                                               Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

R;Sensen, C.W.; Klenk, H.P.; Singh, R.K.; Allard, G.; Chan, C.C.Y.; Liu, Q.Y.; Penny, S.Mol. microbiol. 22, 175-191, 1996
A;Title: Organizational characteristics and information content of an archaeal genome: 1 A;Reference number: S73076; MUID:97055432
A;Reference number: S73076; MUID:97055432
A;Status: nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Reference: EMBL:Y08256; NID:91707679; PIDN:CAA69503.1; PID:91707699
A;Experimental source: strain P2
A;Note: the nucleoited sequence was submitted to the EMBL Data Library, September 1996
C;Superfamily: trehalose trehalohydrolase
C;Keywords: 91ycosidase; hydrolase

C; Comment: This enzyme belongs to the alpha-amylase family. It hydrolyzes the products oligosyl group and trehalose.
C; Genetics:
A; Gene: MTHase
C; Superfamily: trehalose trehalohydrolase
C; Superfamily: trehalose trehalohydrolase
C; Keywords: glycosyltransferase; hexosyltransferase

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SGI. Biotechnol. Biochem. 60:717-720(1996).

CATALYTIC ACTIVITY: Hydrolysis of alpha-(1->4)-D-glucosidic
linkage in 4-alpha-D-{(1->4)-alpha-D-glucanosyl}(n) trehalose
yield trehalose and alpha-(1->4)-D-glucan.
PATHWAY: Trehalose biosynthesis.
SIMILARITY: BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO
KNOWN AS THE ALPHA-AMYLASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16-OCT-2001 (Rel. 40, Created)
